

How to Install WebP Converter

Version: 1.6.0-arm64 | **Released:** June 19, 2026

Why is this necessary?

Apple's macOS includes a security feature called Gatekeeper. Because this application is provided directly by an independent Creative Technologist rather than distributed through the official Mac App Store, Apple automatically attaches a "quarantine" flag to the downloaded file. The one-time Terminal command below simply clears this flag, confirming that you trust the software's origin and allowing it to run smoothly.

1. Install the App

Open the downloaded **.dmg** file and drag the **WebP Converter** icon to the **Applications** folder shortcut provided.

2. The macOS "Damaged" Warning

When you try to open WebP Converter for the first time, macOS may show a warning saying the app is *"damaged and can't be opened"* or that you should move it to the Trash.

Do not panic! The app is not actually damaged.

3. How to Fix It (Takes 10 Seconds)

You can easily clear this security flag using your Mac's built-in Terminal.

- Open the **Terminal** app (you can find it by pressing **Cmd + Space** and typing "Terminal").
- Copy and paste the following exact command into the Terminal window:

```
sudo xattr -rd com.apple.quarantine "/Applications/WebP Converter.app"
```

- Press **Enter**.
- It will ask for your Mac login password. Type it in (your keystrokes won't show up on the screen, which is normal) and press **Enter** again.

4. Open the App

That's it! You can now close the Terminal and open **WebP Converter** from your Applications folder normally. You will not have to do this process again.
